Re:new

- recycling fine particle household waste

Fine particle waste refers to the components of household waste that is smaller than 60 mm. This waste consists primarily of organic waste, glass, plastic, paper, metal and inert materials. Today we are not able to sort out and recycle this part of the waste. In this pre-commercial procurement we challenge the market to develop such a solution.

Our goal is to develop new technology and waste management processes to maximise material recycling of household waste.

Pre-commercial Procurement
